

INFORMATION FOR WOMEN STARTING ANASTRAZOLE (ARIMIDEX) FOR THE TREATMENT OF BREAST CANCER

Newer medications for breast cancer such as anastrozole (Arimidex) are increasingly being used for the treatment of breast cancer. These medications lower the levels of the female hormone estrogen and as a result may result in bone loss and increased risk of fractures. We are studying the early effects of this treatment on bone health. Benefits for participants include monitoring of their bone health during the first year of treatment with anastrozole. There are 6 study visits over 1 year.

If you, or someone you know, is considering taking anastrozole (Arimidex) and would like to know more about participation in this research study, please contact the principal investigator, Dr. Pamela Taxel at (860) 679-4743.
